

Hotel Reservation Android App — Viva Overview

Project Goal

Develop an Android application that allows users to reserve hotel rooms while giving administrators tools to manage rooms, bookings, payments, and notifications.

Platform & Language

Native Android application developed in Java using Android Studio/Gradle.

Users

Two main roles: User/Guest and Administrator.

User Workflow

Register/Login → Dashboard → Rooms → Booking → Payment → Notifications.

Admin Workflow

Admin Login → Dashboard → Add/Manage Rooms → Manage Bookings → View Payments → Send Notifications.

Backend

Firebase Authentication and Firestore provide authentication and cloud data services.

Payments

The project includes PayPal and Braintree payment SDK integrations.

Notifications

Firebase Cloud Messaging and WebSocket/Socket.IO components are used for notification-related functionality.

Key Viva Answer

The project is a native Java Android hotel reservation system combining Firebase cloud services, role-based workflows, booking, payment integration, and notifications.
